Quality Service Parts

Brake Pads

QASPA is line of products dedicated for trucks and commercial vehicles. In base QASPA products group we will find : brake pads, brake discs, brake calipers, brake wear sensors and repair sets for brake system.

Basic idea for QASPA brake articles is searching for optimal product quality. We focus on optimization of quality/price parameter – as, in our opinion, the basic for brake pads working assessments by services. In this process we always care of using of materials and technologies friendly as possible for natural environment. The leading line on this area is QASPA Premium Green&Great. However, all other pads lines benefit from solutions and experience from this articles line.

In our QASPA brake pads production we consequently use few solutions to improve our final product quality. The most important of them are :

In Qaspa brake pads offer we find 4 basic groups (lines) of products :

QASPA STANDARD

in this group we use the best available technologies and materials standard used in this type of products. Because we not use any additional, special technologies – this significantly improves the price/quality relation. Across all QASPA range – this pads have best price/quality ratio. At the same time (according to main rule in QASPA) they remain a high quality product. The fact that they do not have additional technologies – decrease the final price but not decrease the final product quality. Brake efficiency and pads durability stay on very high level. In this group we can find simple pads sets like also sets witch sensors and mounting accessories.

QASPA PREMIUM

in this group we use the best available technologies and materials standard used in this type of products but additionally enriched witch elements improved product quality and comfort of its using. We use in this group (depend on the model) additional technologies such as : Green&Great, Long Life, Heavy Duty and Anti Noise. Knowing the purpose of specific pads we choose best solution for this „working conditions". All using technologies and materials are environmentally friendly (as possible). Of course these are not „cheap" solutions – however this aspect is important to us – that's why this group was created. On the one side, we strong improve the quality and decrease environment pollution, but from other side this technologies are more expensive than the standard ones. This increase the final product price. However, the increase of this two parameters (quality/less pollution) in our opinion far exceeds the small prices increase. Still QASPA Premium pads are one of best on area price/quality ratio. Many customers see a specially longer life and work comfort of this articles. This allows for high efficiency of complete braking system (this improves safety). In this group mostly we have sets witch mounting elements – but we find also brake sets alone.

QASPA CERAMIC

we are pioneers of ceramic pads solutions for commercial vehicles. When this type of products was associated only witch motor sport – we already tried these solutions for „commercial" area. Finally we found this solution as very good for „heavy" vehicles or working in „hard conditions" vehicles (mountains/cities). In this pads group we use ceramic friction material. We developed our own material formula – optimal for this type of application. This guarantees efficient, constant and independent of temperature (to a large extent) brake power. As always looking for quality solutions but at a reasonable price – our ceramic technology is one of the cheapest option on the market. In addition to improving vehicle safety (through constant and high braking efficiency) we also win a longer working time (Ceramic technology is more abrasion resistant – estimated +30% to base products), no dust and visible dirt, minimizing load noises in working time. Of course we use in this group knowledge from Green&Great technology – taking care of materials and technologies and reduced possible environmental pollution. Generally in this group we have brake pads witch sensors included and optionally witch mounting accessories.

QASPA TITANIUM

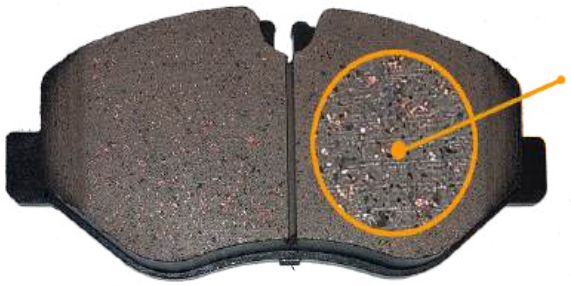

as we are the pioneers of Ceramic technology – as first we also test the using of Titanium friction material for commercial vehicles. In this product group we use Titanium friction material. It has all advantages of ceramic material (high efficiency, temperature resistance, constant brake force) but also additionally longer time of using. From technical side (this is new product on market – and no exist exact statistic data) it is estimated that Titanium pads improve the efficiency and working time on level +30% compared to Ceramic version (so ca +50% to base product). Due to this data ideal for their applications are transport car fleets making long mileage trips (a specially in mountains area) or maximum load vehicles in high traffic cities area (many Start/Stop). Unfortunately, this technology (as many from „newest" solutions) is now a quite expensive solution. For sure as it develops – the costs will surely decrease. Therefore, for now we onnly offer this version of pads for Daily range.
